

## BITBOUNCER

### Staff Productivity & Internet Usage

The modern corporate network consists of constantly changing devices, users and applications. Slow and unresponsive networks directly impact staff productivity and customer experience.

BitBouncer from HSD is a Layer 7 application aware content classifier and filter. Using state-of-the-art packet inspection technology it can identify applications in use on a network in real time and allow key stakeholders (Network Administrators, Corporate Management and Team Leaders) to filter and control the flow of data to and from the Internet.

Added features like automatic device and network topology detection, transparent filtering, browser and smartphone interfaces make BitBouncer a technology that HSD are excited to bring to the corporate environment. HSD are using ongoing customer feedback to continually evolve BitBouncer into the Network Administrator's and Corporate Manager's "Swiss Army Knife" for network analysis, control and troubleshooting.

**Contact HSD for further information on how this can work for your business**
